How Organizations Are Adopting AI: Tools, Strategies, and Risks

DATA ASSESSMENT

HAYLEY HAWKINS

Figure 1

This chart displays the percentage of survey respondents who reported different methods their organizations use to promote AI adoption internally. Responses include strategies such as communicating AI use cases, encouraging experimentation, offering training programs, providing subscriptions to AI tools, and requiring employees to use AI in certain tasks.

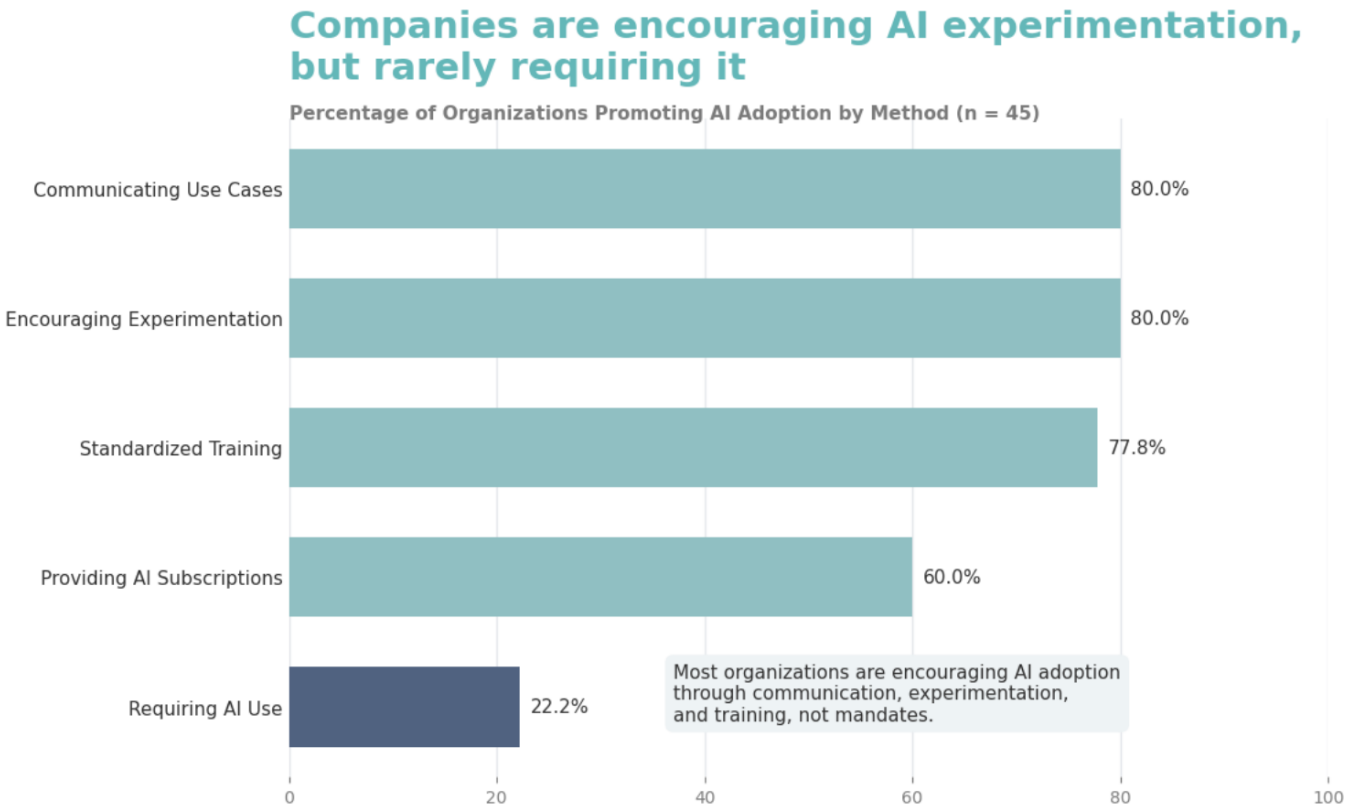

Figure 2

This chart highlights the types of AI tools currently being used within organizations. Categories include text-generation tools, productivity assistants, data analysis tools, and other AI applications that support internal workflows.

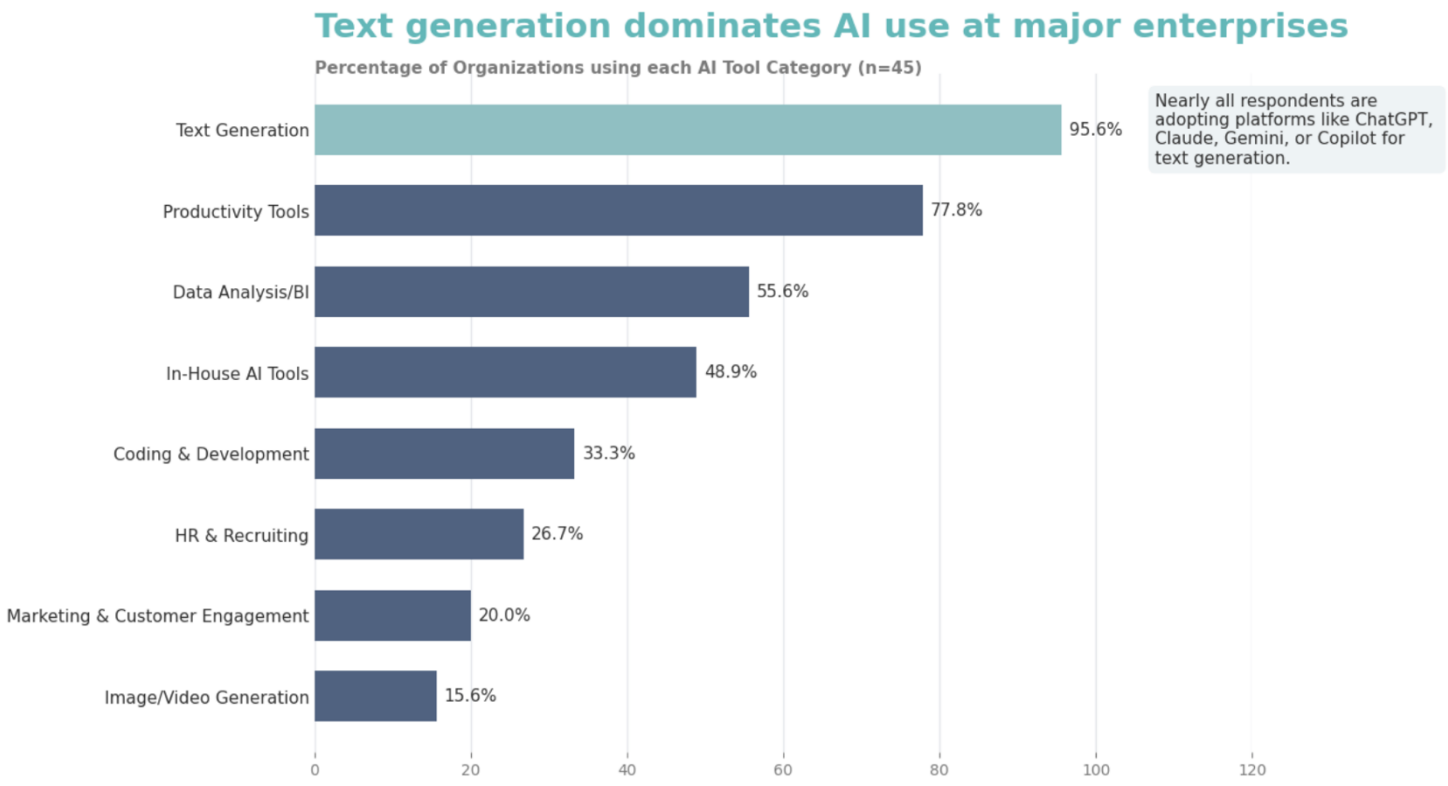

Figure 3

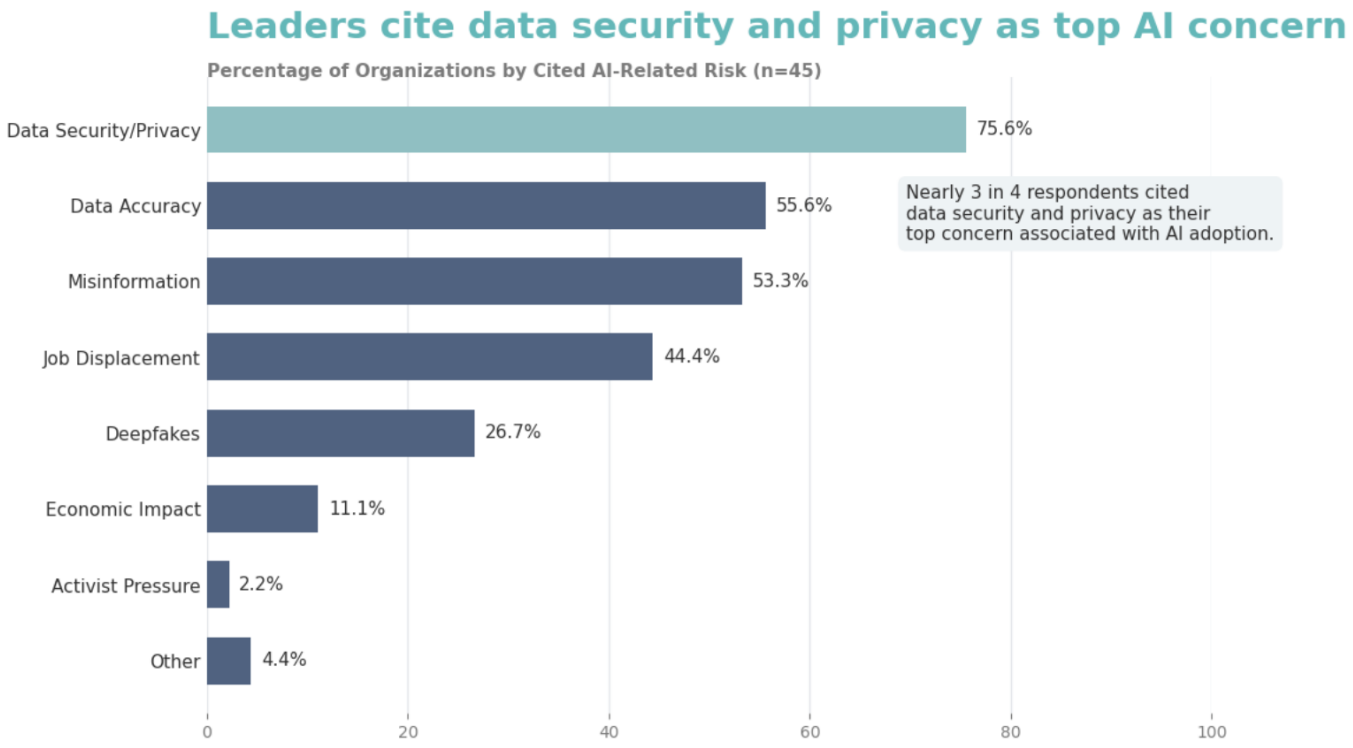
This chart shows the primary concerns organizations have about adopting AI technologies. Reported risks include issues related to data security and privacy, data accuracy, misinformation, employee job displacement, and other potential impacts of AI use.



Executive Summary (250 words)

Introduction

Artificial Intelligence is quickly becoming a routine part of how organizations operate. This report examines how companies are introducing AI to employees, which tools are most widely used, and the primary risks leaders associate with AI adoption.

Methods

Survey data was collected through a 10-question Qualtrics questionnaire examining organizational responses to emerging technologies and societal issues. A total of 45 valid responses were analyzed. Data was cleaned and summarized in Python, where counts and percentages were calculated for each survey question.

Findings and Recommendations

Results suggest organizations are prioritizing encouragement and experimentation over mandates when introducing AI. Eighty percent of respondents reported promoting AI adoption by communicating use cases and encouraging experimentation. However, only 22% require employees to use AI tools, indicating most organizations favor flexible adoption strategies rather than strict implementation policies.

In practice, text-generation tools dominate enterprise AI usage. Nearly all respondents (96%) report using platforms for text generation, significantly outpacing other categories such as productivity tools (78%) and data analysis tools (56%).

At the same time, leaders remain cautious of the risks associated with AI use. Data security and privacy concerns were cited by 76% of respondents.

Cost-effective, scalable recommendations based on these results might include:

- Establishing clear data security and governance frameworks
- Defining approved AI tools for the workplace
- Implementing internal review processes for AI-generated content
- Provide structured training for responsible, efficient AI use
- Track AI adoption and performance more closely among employees
- Define clear AI use cases tied to business goals and employee productivity

Survey Question Revision

Q6: What is AI primarily being used for at your company? [OPTIONAL]

While this question addresses an important topic, it produced only ten responses out of the 45 survey participants. With just over a 20% response rate, there is limited data available to draw meaningful insights. The low response rate may be partially due to the question being marked as optional, which can discourage participation and lead to incomplete datasets.

The question is also highly open-ended, which resulted in responses that mixed AI tools, use cases, and outcomes (for example, "Copilot," "briefing notes," and "efficiency"). Because the responses are not standardized, it becomes difficult to compare answers or identify clear patterns across organizations. According to Pew Research's guidance on survey design, questions should be clear and specific, and structured response options are often preferable when researchers want comparable data across respondents.

Proposed revision:

Which of the following are ways AI is being used at your company today?

- Drafting or editing written content
- Research or information gathering
- Data analysis or reporting
- Coding or software development
- Customer support
- Internal knowledge management
- Marketing or communications
- Image or video creation
- Other (please specify)

This revised version would standardize responses and make the data easier to compare across companies. It would also provide more insight into how companies are currently using AI, which could help inform decisions about where organizations may want to invest further in AI tools, training, or governance.
